

Public Outreach Portfolio

Robiah Oktiavi

A student who explores an incredibly small particles to understand an extremely huge universe, and loves sharing its beauty with others.

This portfolio highlights my one-year journey (2023-2024) as a member of the Public Outreach Team at Bosscha Observatory. It reflects my experiences, contribution, and my long-term goal of continuing to contribute in the field of public outreach.

About Me

Academics

I earned my bachelor's degree in Astronomy and am currently a master's student in Physics. Before my graduate studies, I worked for one-year as an Astronomy communicator at Bosscha Observatory, where I gained hands-on experience in public science communication.

Interests

I am particularly interested in particle detection for my studies, especially hardware-oriented research. At the same time, I am also passionate about public outreach and science communication. I am motivated to help make science approachable and understandable for people from all backgrounds.

Introduction

At the Bosscha Observatory, I mainly took part in public visits and school visits. It helped me to develop my skills in public outreach by engaging with a wide range of audiences and translating complex astronomical concept into simple explanations.

Public visits

There are 2 types of public visits: daytime and nighttime, where I helped guide visitors and explain astronomical phenomena through direct interaction and observation.

School visits

Bosscha Observatory receives visits from schools and universities, where I participated in delivering Astronomy explanations and hands-on activity.

Additional

Bosscha Observatory also organizes annual Hilal observations, bringing together the public and scientific observation.

Public visit

01. Visitors move through multiple stations, including lecture at the Zeiss telescope, an astrophotography exhibition, solar observation, and interactive QnA sessions with astronomers.

02. I was most frequently assigned to the astrophotography exhibition, where I translated scientific and technical aspects of the images.

School visit

01. Students come to Bosscha Observatory and explore the Zeiss telescope, observe the Sun, and participate in hands-on learning activities.

02. The topic of hands-on activities are based on each school's request. To support this, we developed a variety modules for various age group, from preschool to university students.

Hands-on modules

Planning and Design

We planned the module topics and designed each activity based on the students' age.

Testing and Evaluation

We tested each module to evaluate its clarity, effectiveness, and the time required to complete in a real hands-on setting.

Prototyping

We created prototypes of each module to demonstrate the expected final result and help students visualize the outcome.

Implementation

After refinement, the modules were implemented during school visits as part of the hands-on activities.

Hilal Observation

Preparation

We monitored the Moon at different phases to test and calibrate the telescope and software.

Field Setup (H-day)

We set up the telescope at the predetermined location, starting with pointing and polar alignment to ensure accurate tracking.

Observation & Live Report

The observation result were streamed to be compared with observations from other locations.

Reporting

The observation result were reported to the Ministry of Religious Affairs as input for determining the beginning of Ramadan and Shawwal.

Behind the scene

Behind every public and school visit is a series of careful planning, coordination, and evaluation. The meeting ensures that each program was well-structured, meaningful, and engaging for every audience.

OUR MISSION

"The wisdom of the crowd"

The Zooniverse is the world's largest and most popular platform for people-powered research. This research is made possible by volunteers—millions of people around the world who come together to assist professional researchers. Our goal is to enable research that would not be possible, or practical, otherwise. Zooniverse research results in new discoveries, datasets useful to the wider research community, and many **publications**.

Anyone can be a researcher

You don't need any specialized background, training, or expertise to participate in Zooniverse projects. We make it easy for anyone to contribute to real academic research, on their own computer, at their convenience. You'll be able to study authentic data gathered by researchers, like images of faraway galaxies, historical records and diaries, or videos of animals in their natural habitats. By participating in projects, you'll help contribute to our understanding of the world, the universe, and more. With our wide-ranging and ever-expanding suite of projects, which cover many disciplines and topics

NAOJ Citizen Science Project

GALAXY CRUISE

[SEASON 1]

February 19, 2020 — April 25, 2022

[SEASON 2 Deep Quest]

April 18, 2022 — October 31, 2025

GALAXY CRUISE is supported by

JSPS KAKENHI Grant Number JP22H01270.

My goal

My long-term goal is to become a researcher while remaining actively involved in public outreach. I am inspired by citizen science projects such as Zooniverse and Galaxy Cruise which successfully connect the public with scientific research. Coming from Astronomy and transitioned to Physics, my goal is to bridge these two fields and applied citizen projects in the related topics.
